Monday (4 April) heralds the start of a two-month overhaul of a major gas main in Brigg that will keep the gas flowing to local residents for many years into the future.

National Grid will be renewing 600 metres of the gas main in Station Road, from Woods Meadow to Redbourne Road. The existing metal gas main will be replaced with a tough, long-lasting plastic pipe that will last for at least 80 years.

The work will be carried out in five phases. During the first three phases, from Woods Meadow to just past Old Paddock Close, temporary traffic lights will be needed to enable the work to be carried out safely.

The work will be carried out in sections. As each section is completed the traffic lights will be moved down the road.

Traffic management details are currently being confirmed for the remaining phases and more details will be available nearer the time.

National Grid Authorising Engineer Paul Martin said: “This work will keep the gas flowing to local homes and businesses for decades to come.

“We appreciate there will be some disruption and we will make every effort to keep this to a minimum and complete this essential project as soon as possible.”

For any enquiries about this work people should contact National Grid’s customer services team on 0800 096 5678.

ENDS
Notes to Editors:
National Grid is pivotal to the energy systems in the UK and the north eastern United States. We aim to serve customers well and efficiently, supporting the communities in which we operate and making possible the energy systems of the future.

**National Grid in the UK:**
- We own and operate the electricity transmission network in England and Wales, with day-to-day responsibility for balancing supply and demand. We also operate, but do not own, the Scottish networks. Our networks comprise approximately 7,200 kilometres (4,474 miles) of overhead line, 1,500 kilometres (932 miles) of underground cable and 342 substations.
- We own and operate the gas National Transmission System in Great Britain, with day-to-day responsibility for balancing supply and demand. Our network comprises approximately 7,660 kilometres (4,760 miles) of high-pressure pipe and 518 above-ground installations.
- As Great Britain’s System Operator (SO) we make sure gas and electricity is transported safely and efficiently from where it is produced to where it is consumed. From April 2019, Electricity System Operator (ESO) is a new standalone business within National Grid, legally separate from all other parts of the National Grid Group. This will provide the right environment to deliver a balanced and impartial ESO that can realise real benefits for consumers as we transition to a more decentralised, decarbonised electricity system.
- Other UK activities mainly relate to businesses operating in competitive markets outside of our core regulated businesses; including interconnectors, gas metering activities and a liquefied natural gas (LNG) importation terminal – all of which are now part of National Grid Ventures. National Grid Property is responsible for the management, clean-up and disposal of surplus sites in the UK. Most of these are former gas works.
