

# Understanding the consumer bill – Electricity Transmission

Calculation methodology – 2024/25 bill

April 2025

# Energy bills can sometimes be confusing, and it's not always clear what consumers are paying for.

## Read on to find some answers...

**National Grid Electricity Transmission direct charges account for **£19** of the average household electricity bill**

**For this, we perform the following role:**

---

**£19**

**Building and maintaining the wires, cables and substations that make up the England and Wales electricity network, so it continues to be one of the most reliable networks in the world**

---

**What do we mean by consumers?**

When talking about our impact on consumer bills, 'consumer' means households across Great Britain

Our regulator, Ofgem, provides us with an average energy demand per household which we use in our bill calculations

**How is this different to customers?**

Our customers are people or organisations who pay for the products and/ or services they receive from us

# Electricity Transmission: how the £19 is made up

When we invest in the network, the cost is spread so consumers pay over the life of the asset.

Upfront spend comes with an associated cost of raising funds – this is similar to the interest paid on a loan

The day-to-day costs of running the network, including our staff costs

The obligatory charges that we have to pay in order to operate

We are incentivised to provide additional benefits for consumers

We are funded to innovate to ensure we provide future benefits for consumers

For more information on what we do and our performance, please click [here](#).

# How are our charges impacted by regulation?

## Why we are regulated?

Because there's no alternative to our high voltage electricity transmission network, we're classed as a 'natural monopoly'

To simulate the pressures of competition and make sure we're charging fair prices for the services we provide, we're regulated by the energy regulator, Ofgem

Every few years, we submit our future business plans to Ofgem. They review and assess these plans and tell us what we can charge our customers for the next regulatory period, known as a 'price control' period.

## How does regulation impact our charges?

-  Regulation makes sure that our charges represent an efficient cost for the services we provide, whilst also allowing us to invest in the transmission networks and run them properly
-  To encourage us to provide additional benefits for consumers, Ofgem uses financial incentives. These can either be penalties or additional revenue (funded by our customers), depending on whether or not we meet Ofgem's targets.
-  Ofgem incentivises us to find more efficient ways to deliver our activities, if we can find cheaper solutions the benefit is shared between consumers and National Grid.

# How consumer charges are calculated

We calculate our consumer bill impact using Ofgem's consumer bill methodology – this splits costs into segments such as wholesale energy costs, environmental and network charges

The numbers we quote are our **direct impacts** to end consumers. We collect this revenue from electricity generators and suppliers, for example.

This doesn't include the costs we charge to other transmission network users, such as large-scale industrial users.

## What can change the National Grid element of the consumer bill?

There are two key factors which have an impact on consumer bills:

	What is it?	How does it affect the consumer bill?
<b>Factor 1 Revenue</b>	Revenue is the money we collect for the services we provide, as agreed with Ofgem at the start of the price control	Our revenue can go up or down, depending on what we need to deliver  Changes to the way we charge our customers can affect the proportion of revenue we collect from different types of users
<b>Factor 2 Demand</b>	Demand is the amount of energy that is required on the network	Changes in overall demand and average electricity consumption by consumers can alter our bill impact

# How revenue is turned into bill impact

\* Reflects distribution losses

\*\*Figure is subject to rounding; excludes transmission losses to be fair to consumers
